APÉNDICE 2.2

SERIE DE APORTACIONES EN LAS MASAS DE AGUA
SUPERFICIALES TIPO RÍO

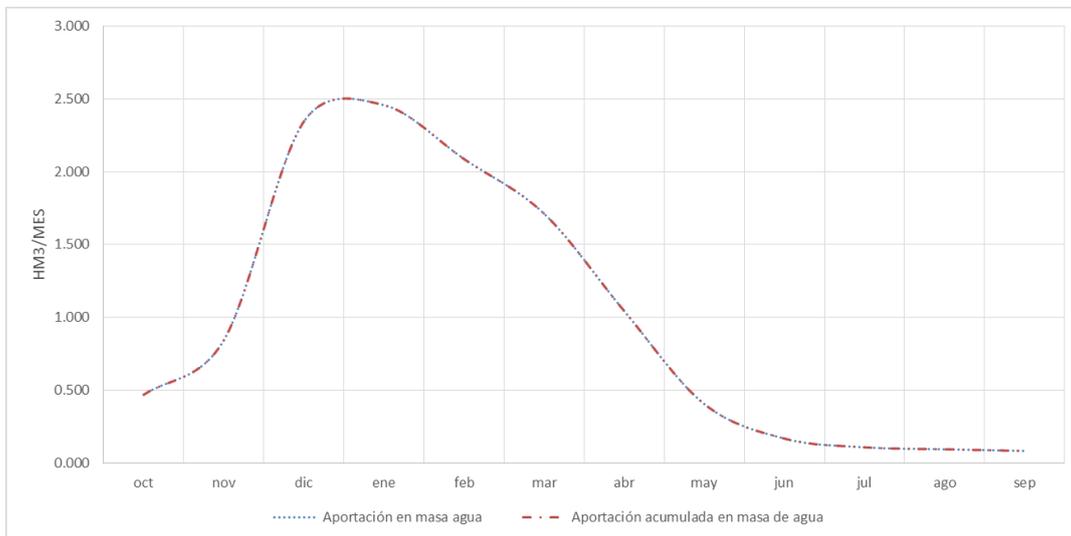

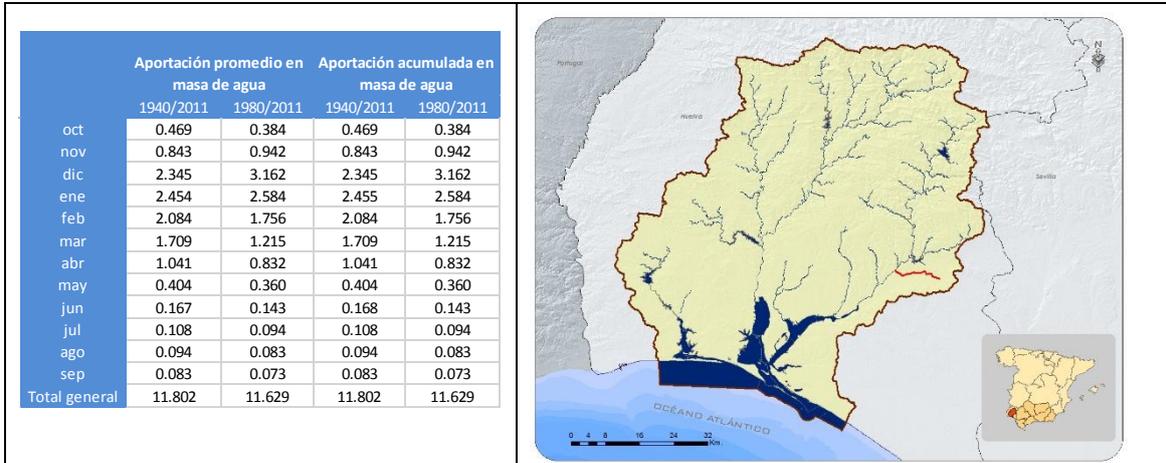

En este apéndice se muestran las principales características de las aportaciones en régimen natural en cada una de las masas de agua superficiales tipo río incluidas en la DHTOP.

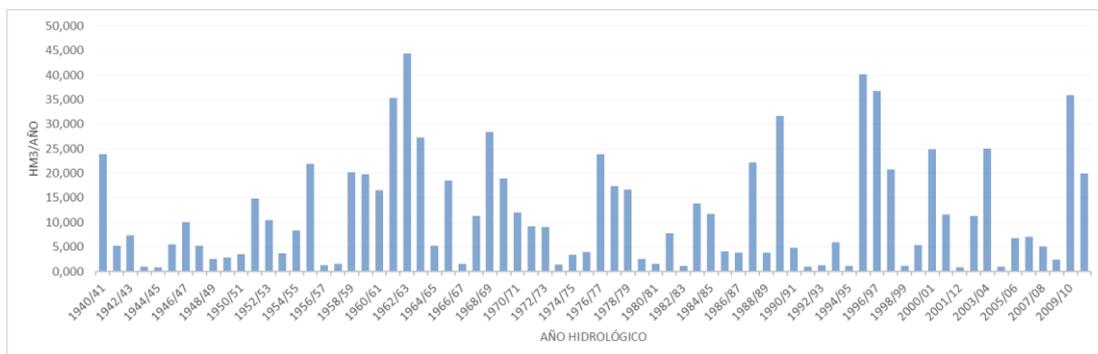

Para cada masa se han estimado las siguientes series:

- Aportación en régimen natural originado en la subcuenca de la masa de agua superficial para la serie 1940/41-2011/12
- Aportación en régimen natural originado en la subcuenca de la masa de agua superficial para la serie 1980/81-2011/12
- Aportación en régimen natural acumulada en la masa de agua superficial para la serie 1940/41-2011/12. Es decir, el caudal circulante por la masa de agua en caso de que no existiera ningún tipo de presión antropogénica aguas arriba de la masa de agua.
- Aportación en régimen natural acumulada en la masa de agua superficial para la serie 1980/41-2011/12. Es decir, el caudal circulante por la masa de agua en caso de que no existiera ningún tipo de presión antropogénica aguas arriba de la masa de agua.
